S.S. Bishop

The Technical Report Series of the Georgia Marine Science Center is issued by the Georgia Sea Grant Program and the Marine Extension Service of the University of Georgia on Skidaway Island (P.O. Box 13687, Savannah, Georgia 31406). It was established to provide dissemination of technical information and progress reports resulting from marine studies and investigations mainly by staff and faculty of the University System of Georgia. In addition, it is intended for the presentation of techniques and methods, reduced data and general information of interest to industry, local, regional, and state governments and the public. Information contained in these reports is in the public domain. If this prepublication copy is cited, it should be cited as an unpublished manuscript.

ACKNOWLEDGEMENTS

The authors thank all those who participated in these cruises. These include the following scientists, technicians and students: Jack Blanton, Beth Bonnett, Tom Creighton, Don Deibel, Marilyn DeVand, Jeff Goodwin, Paul Magid, Jean Nichols, Pat O'Malley, Gus Paffenhofer, Don Rice, Lynn Rubicam and Frank Taylor.

Special thanks go to the captains, mates and crews of the R/V Blue Fin and the R/V Columbus Iselin. Pat O'Malley directed nutrient analyses with the able assistance of Terry DeLoach, Paul Magid and Lynn Rubicam. Bob Redmond, Lori Knight and Dan McIntosh provided drafting and graphics assistance and Linda Land typed the text.

Funding for this research and report preparation was provided by the Department of Energy under contract EY-76-S-09-0889 to Dr. Atkinson.

This report is published as part of the Georgia Marine Science Center's Technical Report series issued by the Georgia Sea Grant Program under NOAA Office of Sea Grant 04-7-158-44126.

ABSTRACT

Seasonal onshore-offshore sections were run in March, May and September, 1977 and January, 1978 off Savannah and Brunswick, Georgia. In each instance upwelling was observed at the shelf break with significant nutrient fluxes into the surface and/or shelf waters. There are indications that eddies may have been responsible for some of these observations.

INTRODUCTION

This report contains data obtained during the following seasonal Georgia Bight cruises:

Table 1. Georgia Bight Cruises.

| Cruise Number | Date | Sections | Parameters Sampled |
|---------------|------------|-------------|---|
| BF-14-77 | 3/8-9/77 | 2 XBT | °C |
| BF-38-77 | 5/26-27/77 | 1 CTD/XBT | °C, °/oo, NO ₃ , PO ₄ , Si |
| BF-57-77 | 9/13-14/77 | 1 CTD/1 XBT | °C, °/oo, NO ₃ , PO ₄ , Si |
| CI-01-78 | 1/23-26/78 | 2 XBT | °C, °/oo, NO ₃ , PO ₄ , Si, Chl-a |

These investigations were part of a larger multi-institutional Department of Energy program to understand event scale, physical, chemical and biological processes of the South Atlantic Bight, the continental shelf region from Cape Canaveral, Florida to Cape Hatteras, North Carolina. The studies reported here were concentrated in the Georgia Bight near Brunswick and Savannah, Georgia. The hydrographic data will be used to compare with data from moored instruments deployed by the University of Miami (Dr. Tom Lee). All data are presented in the Appendix and are on file with the National Oceanographic Data Center (NODC).

METHODS

SAMPLING

One or two onshore/offshore hydrographic sections were run during each cruise. These consisted of conductivity/temperature/depth (CTD) or expendable bathythermograph (XBT) casts along sections extending ESE of Savannah and Brunswick, Georgia. The stations were 10 to 20 kilometers apart and extended out to the shelf break (Figures 1-4).

At CTD stations, a General Oceanics Model 1015 Mark 5 Rosette multi-bottle array was used for water sampling. A Plessey Model 9400 CTD sensor system was attached below the array. Water sampling depths were determined from the temperature structure. Samples were taken near the surface, just above or below the thermocline, at the bottom and occasionally at other selected depths. Data are reported for temperature, salinity, nitrate, phosphate and silicate concentrations. Niskin bottle casts were also made at some but not all of the XBT stations.

CHEMICAL AND PHYSICAL PROCEDURES

Salinity samples were analyzed conductometrically using a Plessey Model 6230 N laboratory salinometer. Values obtained were used to calibrate the Plessey CTD system. A separate section of this report details the CTD calibration procedure. Temperature was determined with deep sea reversing thermometers, XBT's and the CTD system.

Nutrient samples were immediately frozen in 125 ml. polyethylene bottles and stored in the dark until thawed and analyzed ashore. Colorimetric determinations of the nutrient concentrations were made using a Bausch and Lomb Spectronic 88 Spectrophotometer. Silicate was determined by the method of Mullin and Riley (1955) as modified by Strickland and Parsons (1972), phosphate by the method of Murphy and Riley (1962) and nitrate by the cadmium column reduction technique of Gardner *et al.* (1976).

Chlorophyll-a was determined fluorometrically using the method of Yentsch and Menzel (1963) as described by Strickland and Parsons (1972).

XBT Data Acquisition and Processing

A Sippican Model LM3A handheld launcher and an MK2A-1 recorder were used for XBT casts. The temperature/depth plots were manually digitized and these data were placed in NODC format and merged with processed CTD data. Depths at which temperature is a whole or half degree are reported as are depths at which a significant mixed layer begins or ends.

CTD Data Acquisition and Processing

The CTD unit consisted of a Plessey Model 9400 CTD sensor system with a Model 8400 digital data logger and Kennedy Model 1600 incremental magnetic tape recorder for data acquisition and storage. A redundant XY-Y plot was made of all casts using a Hewlett-Packard Model 7046 X-Y-Y recorder calibrated with a precision 10VDC source.

A second data acquisition system under development was also used during these cruises. It involved the addition of an HP 9825A Calculator to control the casts and to record the data on cartridge tape, and an HP 9862A Plotter to plot temperature during the cast and salinity immediately afterwards. This permitted immediate confirmation of data acquisition and its relative quality.

Details of the operation of these systems and the processing of data are presented in Chandler *et al.* (1978). A general outline of the magnetic tape data processing is presented in Table 2.

CTD and XBT Calibration

For primary calibration of temperature and salinity, a Niskin bottle equipped with paired protected deep sea reversing thermometers was tripped after a four-minute equilibration period at the maximum sample depth in mixed layers.

Additional salinity calibration data were collected from mixed layers during the upcast. At the bottom and at selected sampling depths, the CTD sampling rate was slowed and salinity calibration data were acquired before the bottles were tripped.

From analysis of these data (Tables 3 and 4), the following salinity offsets were applied to the CTD data from cruises BF-38-77 and BF-57-77. (Table 5).

Table 5. CTD Salinity Offset Equation

| Cruise | Date | Data Source | %/oo Offset Equation |
|----------|------------|---------------|---|
| BF-38-77 | 5/26-27/77 | HP-Cartridge | +0.06 ± 0.015 |
| BF-57-77 | 9/13-14/77 | Magnetic Tape | * $S = S_0 + .118 - 5.19 \times 10^{-4}D$ |

S_0 = Uncorrected CTD Salinity

D = Depth

* It was necessary to apply an additional correction of -0.11 %/oo to Station 16-C after processing.

The magnetic tape data were normally our primary data source at this stage in the development of our acquisition system. However, the HP cartridge data were used for cruise BF-38-77 because a defective frequency plug resulted in erroneous magnetic tape data. The absence of an apparent depth effect for this same cruise is attributed to the shallowness of the samplings (deepest was 74 meters). Here, the normal instabilities of the instrumentation prohibit the determination of any discernible depth relationship. (See CTD Error Analysis).

The temperature of the CTD system was checked against reversing thermometers (Tables 6 and 7). Since the CTD temperature sensor agreed with protected reversing thermometers within the range of accuracy ($\pm 0.02^\circ\text{C}$), no offset was applied (Table 8). A +2.29 meter depth offset was applied to both sets of CTD data.

Table 8. CTD Temperature Calibration Check.

| Cruise | Date | Mean Difference Reversing Thermometer - CTD | Standard Deviation |
|----------|------------|--|--------------------|
| BF-38-77 | 5/26-27/77 | .018 | .009 |
| BF-57-77 | 9/13-14/77 | .006 | .010 |

The XBT system was checked for proper calibration before and during each cruise with a test canister and periodically with surface bucket and/or near bottom reversing thermometer readings. These indicated that the system operated within acceptable error ($\pm 0.1^\circ\text{C}$).

CTD Error Analysis

The Plessey Model 9400 CTD system has the following rated accuracy, resolution, and time constants (Table 9).

Table 6. Cruise BF-38-77. Temperature Calibration Data.

| Station No. | Depth (m) | REVERSING THERMOMETER TEMPERATURE (°C) | | | CTD Temperature (°C) | Difference (°C) |
|-------------|-----------|--|-------|--------|----------------------|-----------------|
| | | 1 | 2 | Ave | | |
| 2C | 14m | 24.17 | 24.15 | 24.160 | 24.14 | + .020 |
| 4C | 14m | 23.74 | 23.74 | 23.740 | 23.73 | + .010 |
| 5C | 15m | 23.48 | 23.45 | 23.465 | 23.43 | + .035 |

| 12C | 196m | 8.42 | 8.42 | 8.420 | 8.41 | + .010 |

Table 9. Specifications for Plessey Model 9400 CTD System

| | Conductivity | Temperature | Depth |
|---------------|----------------------------|--------------------------|---------------------|
| Accuracy | $\pm 0.03 \text{ mmho/cm}$ | $\pm 0.02^\circ\text{C}$ | $\pm 1.5 \text{ m}$ |
| Resolution | 0.0001 mmho/cm | 0.0001°C | 0.0012 m |
| Time Constant | 0.1 sec | 0.35 sec | 0.1 sec |

Since salinity is not measured directly, it must be calculated from the above parameters, resulting in the composite errors of the C, T and D sensors and the salinity equation.

By varying "real" C, T and D by the rated sensor accuracies in the Broenkow CTD salinity equation (see Chandler *et al.* 1978, and Tables 10 and 11) the maximum error attributable to each sensor can be determined. The composite maximum error is approximately $\pm 0.06^\circ/\text{oo}$ for "real" data sets. However, the standard deviation of all mixed layer samples taken for salinity calibration implies greater accuracy, namely $\pm 0.02^\circ/\text{oo}$ after offset. We believe this value is a more realistic measure of the quality of the data set.

METEOROLOGICAL CONDITIONS

Wind and temperature data from Savannah, Georgia are presented in Figures 5-8. These data were derived from the monthly summaries for the respective months (U.S. Department of Commerce: March 1977, May 1977, September 1977 and January 1978) and are plotted in GMT at three-hour intervals. Additional meteorological data, collected by the ships personnel, are presented with the hydrographic data.

Table 10. Broenkow's Salinity Equations.

$$R_z = 1 + .01\{(1.551 - .0453T + 59 \times 10^{-5}T^2) + \frac{1}{4}(35-S)(.043 - .0017T + 23 \times 10^{-6}T^2)\}(1.037 \times 10^{-3}Z - 32 \times 10^{-9}Z^2)$$

$$A_T = (676547 + 20131.5T + 99.89T^2 - .1943T^3 - .00672T^4) \times 10^{-6}$$

$$R_T = \frac{C(S, T, Z)}{R_z A_T 42.896}$$

$$\Delta_{15} = R_T(R_T - 1)(T - 15) \{96.7 - 72R_T + 37.3R_T^2 - (.63 + .21R_T^2)(T - 15)\} \times 10^{-5}$$

$$R_{15} = R_T + \Delta_{15}$$

$$S^0/\text{oo} = .08996 + 28.2972R_{15} + 12.80832R_{15}^2 - 10.67869R_{15}^3 + 5.98624R_{15}^4 - 1.32311R_{15}^5$$

where: R = conductivity ratio

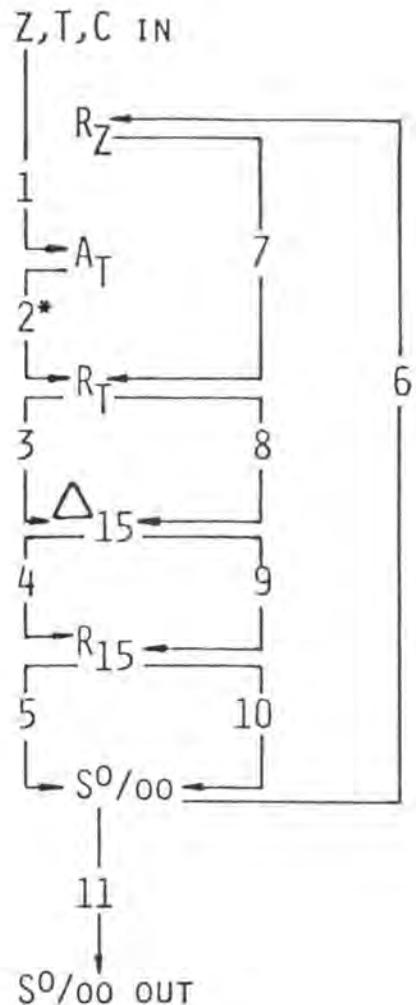

Z = depth (meters)

T = temperature ($^{\circ}\text{C}$)

C = measured conductivity (mmhos/cm)

S = salinity ($^{\circ}/\text{oo}$)

Table 11. Flow Using Broenkow's Salinity Equation

*without the R_Z term

R_Z = pressure effect on conductivity

A_T = temperature effect

$R_T = R(S, t, p)$ conductivity ratio

Δ_{15} = t_{15} correction (International Oceanographic Tables, 1966)

$R_{15} = R(S, 15^{\circ}\text{C}, 0)$

RESULTS AND DISCUSSION

Savannah Section, 8-9 March 1977. (Figure 9)

Deep upwelling at the shelf break is indicated, and there is the appearance of cascading along the mid to outer shelf (stations 8X and 9X). This, however, may be due to by warmer offshore waters. No nutrient data were collected.

Brunswick Section, 9 March 1977. (Figure 9)

Upwelling is occurring at the shelf break. The 21°C lobe at stations 25X and 26X suggests that the upwelling may have resulted from an eddy. Note the differences in the vertical structure on the shelf between this section and the Savannah section, a horizontal distance of less than 60 nautical miles (111 kilometers). No nutrient data were collected.

Savannah Section, 26-27 May 1977. (Figures 10-11)

The temperature and sigma-t plots reveal an upwelling regime centered around station 13X/C. The nutrient data, however, reveal that significant nutrient concentrations did not occur in the surface waters because of the high temperatures.

The warm surface lobe at stations 11C and 12X with cooler waters at stations 13X/C and 14C, and then warmer waters again at station 15X suggest an eddy. A similar trend is seen in the density field where density increases and then decreases moving offshore at the shelf break.

Brunswick Section, 13-14 September 1977. (Figures 12-13).

A strong upwelling regime has been established at the shelf break with significant nutrient enrichment of the surface waters. The upwelling is evident in all parameters. Cooler, high nutrient waters are producing an "intrusion" on the shelf.

Savannah Section, 14 September 1977. (Figures 14-15)

Upwelling similar to that shown for the Brunswick section on 13-14 September is evident. However, nutrient concentrations in the shallower waters are not as great.

Savannah Section, 23-24 January, 1978. (Figures 16-17)

There is an overriding of shelf waters by warmer offshore waters with the 20°C isotherm roughly depicting the western wall of the Gulf Stream. Deep upwelling is apparent at the shelf break and high levels of nitrate, phosphate and silicate have reached the surface. In addition, there are extremely high chlorophyll concentrations in the surface waters at the shelf break, a further indication of strong upwelling.

Brunswick Section 24-25 January 1978. (Figures 18-19)

Strong upwelling at the shelf break is indicated by the nitrate and silicate data. This upwelling feature is less obvious in plots of the other parameters.

SUMMARY

Upwelling was observed at the shelf break during each of the cruises in March, May, September and January. This resulted in significant nutrient enrichment of surface and shelf waters. Nutrient concentrations as high as 5 μM nitrate, .2 μM phosphate and 2 μM silicate were observed in the top 30 m.

Gulf Stream eddies and meanders are probable explanations for at least some of the observed upwelling. However, confirmation will depend upon analysis of current meter data from moorings placed in the study area by the University of Miami (Dr. Tom Lee).

APPENDIX

Hydrographic Data

HYDROGRAPHIC DATA

Vertical profiles of salinity, temperature, sigma-t, DO and nutrients

The symbols used in the following listings are defined as follows:

Header Data: Times are GMT (EST + 5 or EDT + 4)
Latitude and Longitude are from Loran C

Weather Data: These data are taken from the ship's log.

Wind speed (knots)
Wind direction (degrees)
Air temperature ($^{\circ}$ C)
Weather (WMO code 4501)
Barometric pressure (mb)
Sea state (WMO 3700)
Wave direction (degrees)
Cloud type (not given)
Cloud amount (not given)
Visibility code (not given)

Observations: Z = Depth in meters
T = Temperature in $^{\circ}$ C
S = Salinity in ‰
D = Density in sigma-t units
SVA = Specific volume anomaly X 10^5
 O_2 = Dissolved oxygen in ml/liter
 O_2' = Oxygen saturation in ml/liter
AOU = Apparent oxygen utilization in ml/liter
PO₄ = Phosphate concentration in μ mole/liter
NO₃ = Nitrate concentration in μ mole/liter
Si = Silicate concentration in μ mole/liter

BF-14-77

8-9 March 1977
