Erratum to: Improving protein order-disorder classification using charge-hydrophathy plots

Fei Huang¹, Christopher J. Oldfield¹, Bin Xue², Wei-Lun Hsu¹, Jingwei Meng¹, Xiaowen Liu¹, Li Shen¹, Pedro Romero³, Vladimir N. Uversky^{4,5,6} and A. Keith Dunker^{1*}

During the production of our manuscript [1], an incorrect Figure 1 was put in place of the one we submitted, and we erred in not appropriately informing the production staff of this mistake. The corrected figure and the text describing this figure, as well as the figure legend, are present herein.

As stated in our manuscript [1], “The C-H plots generated using scale SVM parameters scale, Kyte-Doolittle hydrophathy scale, and Guy hydrophathy scale for whole protein prediction are shown in Figure 1. Figure 1A, which is derived by SVM parameters scale, shows many fewer misclassified disordered proteins on the ordered side, compared to Figure 1B and 1C.”

As further stated in reference [1]: “Figure 1. Charge-Hydrophathy plots. In (A) the IDP-Hydrophathy scale was used, in (B) the Guy (1985) Hydrophathy scale was used, and in (C) the Kyte-Doolittle (1981) hydrophathy scale was used. Red circles indicate disordered proteins, blue circles indicate structured proteins. For these plots, each scale was normalized to be in the interval of 0 to 1. The Guy’s scale is multiplied by -1 prior to normalization to conform to the energy rule set by Kyte-Doolittle scale. In (A) the function describing the boundary is: $\langle \text{charge} \rangle = 3.31 \langle \text{hydrophathy} \rangle - 0.97$. In (B) the function describing the boundary is: $\langle \text{charge} \rangle = 2.32 \langle \text{hydrophathy} \rangle - 0.93$. In (C), the function describing the boundary is $\langle \text{charge} \rangle = 1.35 \langle \text{hydrophathy} \rangle - 0.49$.”

For more details, the reader is referred to the published manuscript [1].

Full list of author information is available at the end of the article

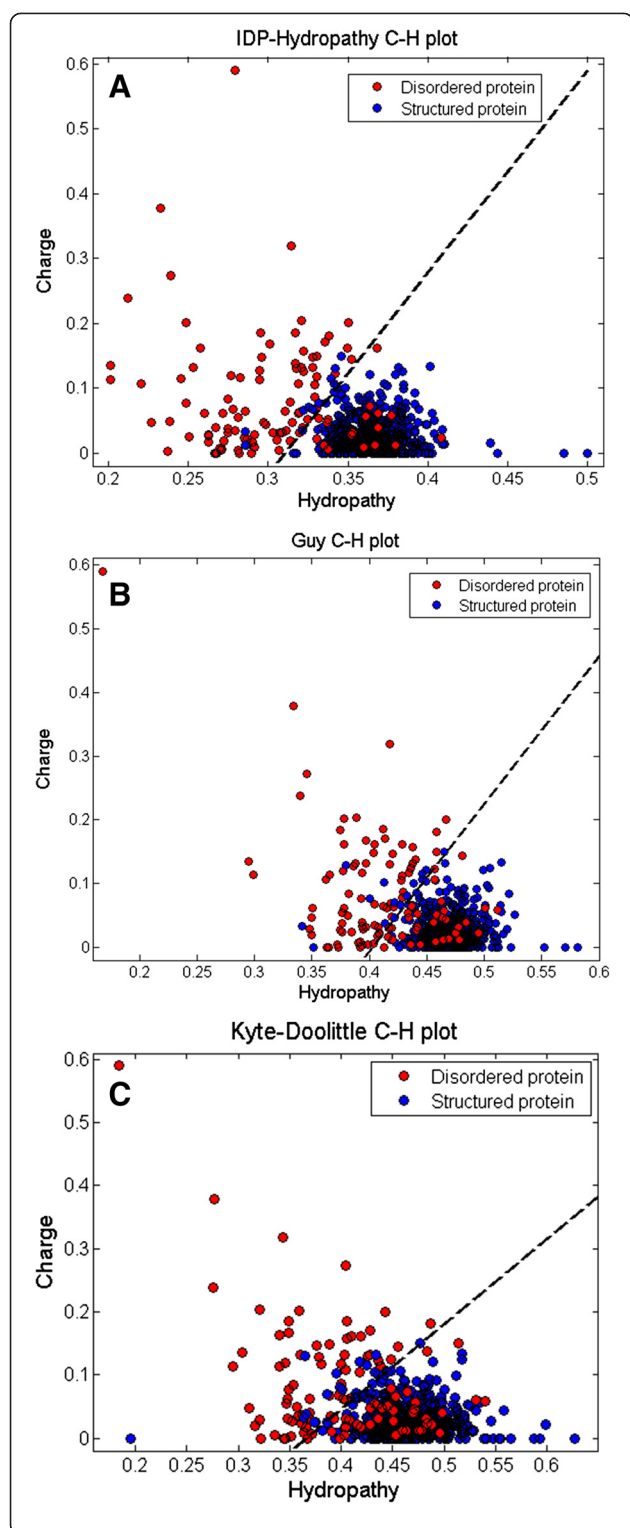

Figure 1. Charge-Hydropathy plots. In (A) the IDP-Hydropathy scale was used, in (B) the Guy (1985) Hydropathy scale was used, and in (C) the Kyte-Doolittle (1981) hydropathy scale was used. Red circles indicate disordered proteins, blue circles indicate structured proteins. For these plots, each scale was normalized to be in the interval of 0 to 1. The Guy's scale is multiplied by -1 prior to normalization to conform to the energy rule set by Kyte-Doolittle scale. In (A) the function describing the boundary is: $\langle \text{charge} \rangle = 3.31 \langle \text{hydropathy} \rangle - 0.97$. In (B) the function describing the boundary is: $\langle \text{charge} \rangle = 2.32 \langle \text{hydropathy} \rangle - 0.93$. In (C), the function describing the boundary is: $\langle \text{charge} \rangle = 1.35 \langle \text{hydropathy} \rangle - 0.49$.

Submit your next manuscript to BioMed Central and take full advantage of:

- Convenient online submission
- Thorough peer review
- No space constraints or color figure charges
- Immediate publication on acceptance
- Inclusion in PubMed, CAS, Scopus and Google Scholar
- Research which is freely available for redistribution
